

§5.3* Orthonormal Bases: Gram-Schmidt Process (Continued)

Example 1. Show that the set is an orthonormal basis for R^3 .

$$S = \{\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3\} = \left\{ \left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 0 \right), \left(-\frac{\sqrt{2}}{6}, \frac{\sqrt{2}}{6}, \frac{2\sqrt{2}}{3} \right), \left(\frac{2}{3}, -\frac{2}{3}, \frac{1}{3} \right) \right\}$$

Theorem 5.10. If $S = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ is an orthogonal set of nonzero vectors in an inner product space V , then S is linearly independent.

Theorem 5.11. If $B = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ is an orthonormal basis for an inner product space V , then the coordinate representation of a vector \mathbf{w} relative to B is

$$\mathbf{w} = (\mathbf{w} \cdot \mathbf{v}_1)\mathbf{v}_1 + (\mathbf{w} \cdot \mathbf{v}_2)\mathbf{v}_2 + \dots + (\mathbf{w} \cdot \mathbf{v}_n)\mathbf{v}_n.$$

Theorem 5.12* (Gram-Schmidt Orthonormalization Process).

1. Let $B = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ be a basis for an inner product space V .
2. Let $B' = \{\mathbf{w}_1, \mathbf{w}_2, \dots, \mathbf{w}_n\}$, where

$$\begin{aligned} \mathbf{w}_1 &= \mathbf{v}_1 \\ \mathbf{w}_2 &= \mathbf{v}_2 - \frac{\mathbf{v}_2 \cdot \mathbf{w}_1}{\mathbf{w}_1 \cdot \mathbf{w}_1} \mathbf{w}_1 \\ \mathbf{w}_3 &= \mathbf{v}_3 - \frac{\mathbf{v}_3 \cdot \mathbf{w}_1}{\mathbf{w}_1 \cdot \mathbf{w}_1} \mathbf{w}_1 - \frac{\mathbf{v}_3 \cdot \mathbf{w}_2}{\mathbf{w}_2 \cdot \mathbf{w}_2} \mathbf{w}_2 \\ &\vdots \\ \mathbf{w}_n &= \mathbf{v}_n - \frac{\mathbf{v}_n \cdot \mathbf{w}_1}{\mathbf{w}_1 \cdot \mathbf{w}_1} \mathbf{w}_1 - \frac{\mathbf{v}_n \cdot \mathbf{w}_2}{\mathbf{w}_2 \cdot \mathbf{w}_2} \mathbf{w}_2 - \dots - \frac{\mathbf{v}_n \cdot \mathbf{w}_{n-1}}{\mathbf{w}_{n-1} \cdot \mathbf{w}_{n-1}} \mathbf{w}_{n-1}. \end{aligned}$$

Then B' is an *orthogonal* basis for V .

2. Let $\mathbf{u}_i = \frac{\mathbf{w}_i}{\|\mathbf{w}_i\|}$. Then $B'' = \{\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_n\}$ is an *orthonormal* basis for V . Also, $\text{span}\{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_k\} = \text{span}\{\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_k\}$ for $k = 1, 2, \dots, n$.

Example 7*. Apply the Gram-Schmidt orthonormalization process to the basis B for R^3 .

$$B = \{\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3\} = \{(1, 1, 0), (1, 2, 0), (0, 1, 2)\}.$$

[Soluition] From the handout 5.1-5.3, we saw that the Gram-Schmidt yields an orthonormal basis by means of projection

$$\begin{aligned} \mathbf{u}_1 &= \left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 0 \right) \\ \mathbf{u}_2 &= \left(-\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 0 \right) \\ \mathbf{u}_3 &= (0, 0, 1) \end{aligned}$$

such that $\text{span}\{\mathbf{u}_1, \mathbf{u}_2, \mathbf{u}_3\} = \text{span}\{\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3\} = \mathbb{R}^3$.

Ex. #15. The set $S = \{\mathbf{v}_1, \mathbf{v}_2\}$ is orthogonal but not orthonormal.

$$(1) \quad \{(\sqrt{3}, \sqrt{3}, \sqrt{3}), (-\sqrt{2}, 0, \sqrt{2})\}$$

Indeed,

$$(2) \quad (\sqrt{3}, \sqrt{3}, \sqrt{3}) \cdot (-\sqrt{2}, 0, \sqrt{2}) = -\sqrt{6} + 0 + \sqrt{6} = 0,$$

However,

$$\begin{aligned}\|\mathbf{v}_1\| &= \sqrt{9} = 3 \neq 1 \\ \|\mathbf{v}_2\| &= 2 \neq 1.\end{aligned}$$

Normalize *each vector* to obtain an orthonormal set.

$$\begin{aligned}\mathbf{u}_1 &= \frac{\mathbf{v}_1}{\|\mathbf{v}_1\|} = \left(\frac{\sqrt{3}}{3}, \frac{\sqrt{3}}{3}, \frac{\sqrt{3}}{3}\right) \\ \mathbf{u}_2 &= \frac{\mathbf{v}_2}{\|\mathbf{v}_2\|} = \frac{1}{2}(-\sqrt{2}, 0, \sqrt{2}) = \left(-\frac{\sqrt{2}}{2}, 0, \frac{\sqrt{2}}{2}\right).\end{aligned}$$

Chapter 6*. Linear Transformations.

Chapter 7. Eigenvalues and Eigenvectors

§7.1 Eigenvalues and Eigenvectors

Definition. Let A be an $n \times n$ matrix. The scalar λ is an **eigenvalue** of A when there is a *nonzero* vector \mathbf{x} such that $A\mathbf{x} = \lambda\mathbf{x}$. The vector \mathbf{x} is an **eigenvector** of A corresponding to λ .

Example 2. For the matrix $A = \begin{bmatrix} 1 & -2 & 1 \\ 0 & 0 & 0 \\ 0 & 1 & 1 \end{bmatrix}$, verify that $\mathbf{x}_1 = (-3, -1, 1)$ and $\mathbf{x}_2 = (1, 0, 0)$ are eigenvectors of A and find their corresponding eigenvalues.

Theorem 7.1. If A is an $n \times n$ matrix with an eigenvalue λ , then the set of all eigenvectors of λ , together with the zero vector, is a subspace of R^n . This subspace is the **eigenspace** of λ .

Theorem 7.2. Let A be an $n \times n$ matrix.

1. An eigenvalue of A is a scalar λ such that $\det(\lambda I - A) = 0$.
2. The eigenvectors of A corresponding to λ are the nonzero solutions of $(\lambda I - A)\mathbf{x} = \mathbf{0}$.

Example 4. Find the eigenvalues and corresponding eigenvectors of $A = \begin{bmatrix} 2 & -12 \\ 1 & -5 \end{bmatrix}$.

Example 5. Find the eigenvalues and corresponding eigenvectors of $A = \begin{bmatrix} 2 & 1 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{bmatrix}$.

(from the text) Verify that λ_i is an eigenvalue of A and that \mathbf{x}_i is a corresponding eigenvector.
Ex.# 5.

$$A = \begin{bmatrix} 2 & 3 & 1 \\ 0 & -1 & 2 \\ 0 & 0 & 3 \end{bmatrix}$$

$$\lambda_1 = 2, \quad x_1 = (1, 0, 0)$$

$$\lambda_2 = -1, \quad x_2 = (1, -1, 0)$$

$$\lambda_3 = 3, \quad x_3 = (5, 1, 2).$$

Ex. # 7.

$$(3) \quad A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{bmatrix} \quad \lambda_1 = 1, \quad x_1 = (1, 1, 1)$$

Solution. Step 1. Solving $|\lambda - A| = \lambda^3 - 1 = (\lambda - 1)(\lambda^2 + \lambda + 1) = 0$, we obtain $\lambda_1 = 1$ ($\lambda_{2,3} = \frac{-1 \pm \sqrt{3}i}{2}$, complex roots)

Step 2. Solve the homogeneous equation $(\lambda - A)X = 0$ to find $E_1 = \text{span}\{(1, 1, 1)^T\}$. \square

§7.2 Diagonalization

Definition. An $n \times n$ matrix A is **diagonalizable** when A is similar to a diagonal matrix. That is, A is diagonalizable when there exists an invertible matrix P such that $P^{-1}AP$ is a diagonal matrix.

Example 1. The matrix $A = \begin{bmatrix} 1 & 3 & 0 \\ 3 & 1 & 0 \\ 0 & 0 & -2 \end{bmatrix}$ is diagonalizable with $P = \begin{bmatrix} 1 & 1 & 0 \\ 1 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$.

Solution. Step 1. Find inverse of P : $P^{-1} = \begin{bmatrix} \frac{1}{2} & \frac{1}{2} & 0 \\ \frac{1}{2} & -\frac{1}{2} & 0 \\ 0 & 0 & 1 \end{bmatrix}$.

Step 2. We see that $P^{-1}AP = \begin{bmatrix} 4 & 0 & 0 \\ 0 & -2 & 0 \\ 0 & 0 & -2 \end{bmatrix}$. \square

Theorem 7.4. If A and B are similar $n \times n$ matrices, then they have the same eigenvalues.

Theorem 7.5. An $n \times n$ matrix A is diagonalizable if and only if it has n linearly independent eigenvectors.

Example 4. Show that the matrix $A = \begin{bmatrix} 1 & -1 & -1 \\ 1 & 3 & 1 \\ -3 & 1 & -1 \end{bmatrix}$ is diagonalizable. Then find a matrix P such that $P^{-1}AP$ is diagonal.

Example 5.* Show that the matrix $A = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 5 & -10 \\ 1 & 0 & 2 & 0 \\ 1 & 0 & 0 & 3 \end{bmatrix}$ is diagonalizable. Then find a matrix P such that $P^{-1}AP$ is diagonal.

Example 6. Show that the matrix $A = \begin{bmatrix} 1 & 2 \\ 0 & 1 \end{bmatrix}$ is not diagonalizable.

Theorem 7.6. If an $n \times n$ matrix A has n distinct eigenvalues, then the corresponding eigenvectors are linearly independent and A is diagonalizable.

Example 7. Determine whether A is diagonalizable.

$$A = \begin{bmatrix} 1 & -2 & 1 \\ 0 & 0 & 1 \\ 0 & 0 & -3 \end{bmatrix}$$

[Solution] Because A is a triangular matrix, its eigenvalues are the main diagonal entries $\lambda_1 = 1$, $\lambda_2 = 0$, $\lambda_3 = -3$. Moreover, since these three are distinct, we conclude from Theorem 7.6 that A is **diagonalizable**.

Ex.#3. Verify that A is diagonalizable by computing $P^{-1}AP$.

$$A = \begin{bmatrix} -2 & 4 \\ 1 & 1 \end{bmatrix} \quad P = \begin{bmatrix} 1 & -4 \\ 1 & 1 \end{bmatrix}$$

12. Show that the matrix is not diagonalizable.

$$\begin{bmatrix} 1 & 0 \\ -2 & 1 \end{bmatrix}$$

Solution. The equation $P^{-1}AP = D$ is equivalent to $AP = PD$, both of which are equivalent to

$$A\mathbf{v}_i = \lambda_i \mathbf{v}_i \quad i = 1, \dots, n$$

where λ_i and \mathbf{v}_i are couples of eigenvalue-eigenvectors

$$D = \begin{pmatrix} \lambda_1 & & \\ & \ddots & \\ & & \lambda_n \end{pmatrix}$$

and

$$P = (\mathbf{v}_1 \quad \cdots \quad \mathbf{v}_n).$$

According to Theorem 7.5 and the above general paradigm, we solve for the eigenvectors or eigenspace(s). First $A = \begin{bmatrix} 1 & 0 \\ -2 & 1 \end{bmatrix}$ is a lower triangular matrix, so the eigenvalues are all on

the diagonal: $\lambda_1 = \lambda_2 = 1$. To obtain the eigenvectors, we solve

$$\begin{aligned}(1 \cdot I - A) \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} &= \begin{pmatrix} 0 \\ 0 \end{pmatrix} \\ \begin{pmatrix} 0 & 0 \\ 2 & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} &= \begin{pmatrix} 0 \\ 0 \end{pmatrix}\end{aligned}$$

This translates to

$$\begin{cases} 0 = 0 \\ 2x_1 + 0x_2 = 0 \end{cases} \Rightarrow \begin{cases} x_1 = 0 \\ x_2 = t \end{cases} \quad t \in \mathbb{R}$$

Thus the solution shows that the eigenspace corresponding to $\lambda = 1$ is given by $E_1 = \text{span}\left\{\begin{pmatrix} 0 \\ 1 \end{pmatrix}\right\}$. Hence A has only one linearly independent eigenvector. This shows A is NOT diagonalizable by Th.7.5. \square

Example 10* How about the following: Diagonalizable or not diagonalizable ?

- (1) $\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$
- (2) $\begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$
